        "content": "## This workflow automates publishing posts to a LinkedIn
Organization Page via the LinkedIn API.\nIt supports four post types: Text,
Article, Image, and Video.\nIncoming requests are validated via a Webhook trigger,
processed based on post_type, and then routed through LinkedIn’s ugcPosts API using
the organization URN (urn:li:organization:{id}).\n\n## ▫ Steps Breakdown\n1.
Webhook (Trigger)\nEndpoint receives incoming POST request.\nExtracts request body
containing:\npost_type (text, article, image, video)\nOther fields depending on
type (text, media URL, title, etc.).\n\n2. Validate Request Payload\nEnsures
post_type exists in the incoming request.\nIf missing → returns Incorrect request
payload response.\n\n3. Switch: Post Type\nRoutes workflow to one of the supported
post types:\ntext → Text post branch\narticle → Article post branch\nimage → Image
post branch\nvideo → Video post branch\nIf invalid → returns Incorrect post type
response.\n\n## ▫ Post Type Branches\n3.1 Text Post\nValidation: Checks if text
field exists.\nOrganization Lookup: Fetches organization URN where user is
ADMINISTRATOR.\nPost Creation: Sends POST request to /ugcPosts with:\nauthor =
urn:li:organization:{id}\nshareCommentary.text = request text\nshareMediaCategory =
NONE\nResponse: Success or error returned to client.\n\n3.2 Article Post\
nValidation: Requires text, article_media_url, article_title.\nOrganization Lookup:
Gets organization URN.\nPost Creation: Sends POST request with:\nshareMediaCategory
= ARTICLE\nmedia = article link & title\nResponse: Success message returned.\n\n3.3
Image Post\nValidation: Requires text, image_url, image_title.\nOrganization
Lookup: Gets organization URN.\nRegister Upload: Calls POST /assets?
action=registerUpload with organization as owner.\nGet Binary: Downloads image from
given URL.\nUpload: PUT request to LinkedIn upload URL with binary image.\nCreate
Post: Sends POST /ugcPosts with:\nshareMediaCategory = IMAGE\nmedia = uploaded
asset ID\nResponse: Success message returned.\n\n3.4 Video Post\nValidation:
Requires text, video_url, video_title.\nOrganization Lookup: Gets organization
URN.\nRegister Upload: Calls POST /assets?action=registerUpload for video asset.\
nGet Binary: Downloads video file.\nUpload: PUT request to LinkedIn upload URL with
binary video.\nCreate Post: Sends POST /ugcPosts with:\nshareMediaCategory = VIDEO\
nmedia = uploaded asset ID\nResponse: Success message returned.",

TOOL-LogEvent**\n\n* Uses a **Code node** (`Prepare payload for TOOL-LogEvent`) to
build a structured JSON payload that includes metadata like workflow ID, execution
info, custom data, and request body details.\n\n**2. Invoke TOOL-LogEvent**\n\n*
Uses an **HTTP Request node** (`Invoke TOOL-LogEvent`) to send that payload as a
**POST** request to an external webhook endpoint for logging or monitoring.\n* Both
nodes are configured with `onError: continueRegularOutput`, ensuring the workflow
continues even if errors occur.\n\n### **Purpose and Flow**\n\n* The first node
gathers and formats key execution data.\n* The second node transmits this data to a
remote logging endpoint.\n* This setup facilitates **automated logging** while
maintaining workflow resilience.\n",
